Application Name: Bookshelf.init

Description:

This application will serve as a platform where users can upload study documents and class materials and provide online articles and resource suggestions to collaborate with other students. The upload function will allow a user to upload PDF files and host them on the website. Once uploaded, other users can make comments on the submission, and can also favorite a document so that it appears in their profile page.

Bookshelf will be able to provide article and resource suggestions through user searched keywords. Given these keywords, the site will display the top study results that match the search. Filters will also be provided to allow the user to choose which type of resources to search from, and can group these results by project and subject. These resources will allow users to study more efficiently and access information to guide them.

Vision Statement:

To create the ultimate study resources search website for students, where they can collaborate with others and access relevant resources.

Wireframes:

LINK TO FIGMA:

etc

- study guide + study article + paper filter app (ie. find suggested readings)

- SG: add tags (internal search) (look for upload apis)

- look for study related api + csv files
